Final Report Summary

DATABUZZ

What the data tells us:

- **The 10% Problem:** A small group of people (our Top 10) is causing most of our money problems. People with a **Risk Score over 75** are twice as likely to make a claim.
- **Age Matters:** Our youngest and oldest drivers are the most expensive to cover. Right now, their insurance isn't high enough to cover the cost of their accidents.
- **Where the money goes:** The **East Region** has the biggest, most expensive claims, while the **West** has many small accidents that add up quickly.

What we should do next:

- **Charge more for High Risk:** We need to raise prices for anyone in the "Red Zone" or anyone with very little driving experience.
- **Find better customers:** If we can get just 5% more "Low-Risk" drivers to join us, we could save roughly **12% in payouts**.
- **Watch the middle group:** We should give discounts to "Amber" drivers (scores 50-70) who stay safe so they don't become "Red" risks later.

The bottom line: We are losing money in ways we can predict. By using this dashboard to spot high-risk drivers early, we can stop big losses before they happen and make the business much more profitable.
